

Readers Haven: Dynamic Inventory Management

LZPMPC005L PROGRAMMING CLINIC - WEEK 2

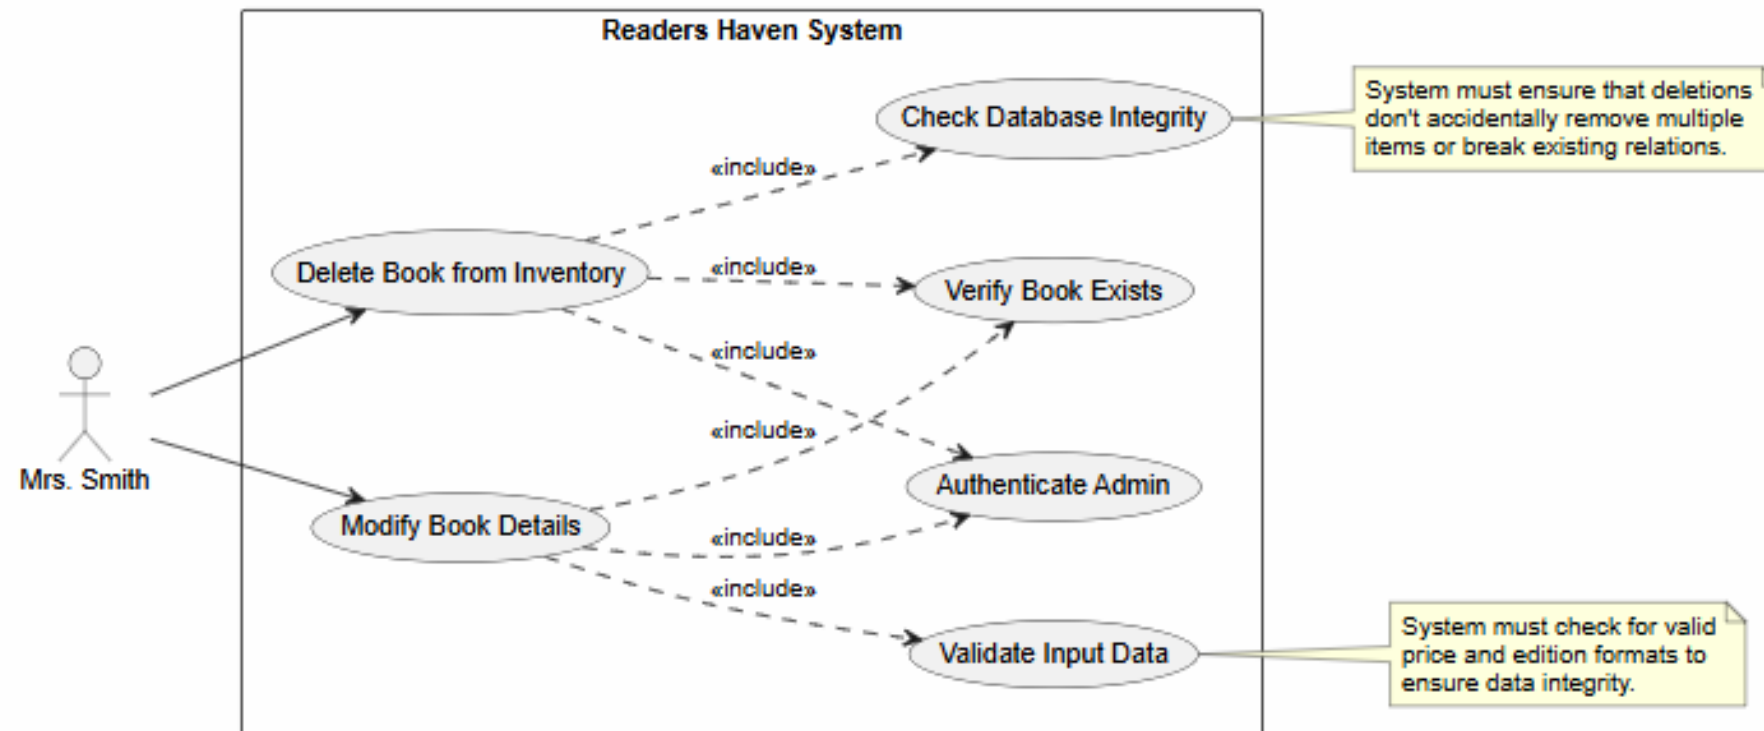

ALIBAY BASHIROV

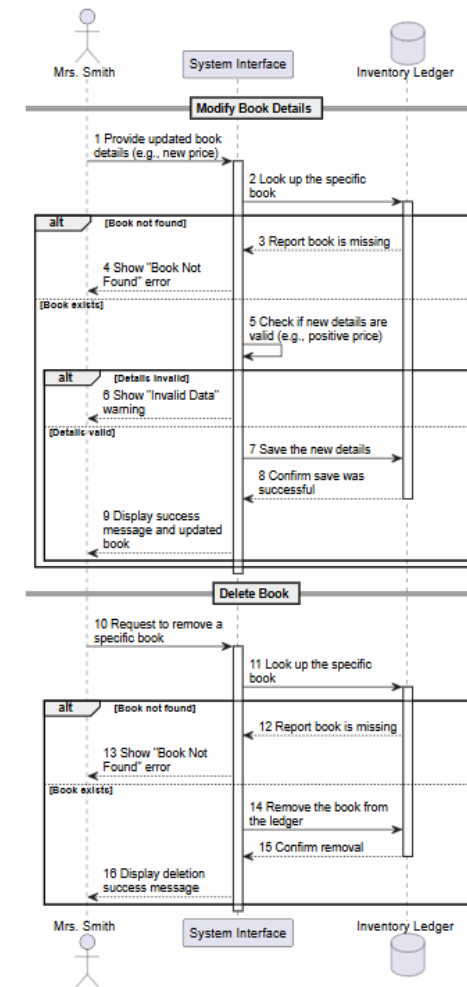

Introduction & Approach

- Upgrading the "Readers Haven" digital inventory to handle dynamic stock changes. Mrs. Smith needs to modify existing book details (like price or edition) and completely remove books that are no longer available.
- Continuing with an API-first architecture, implementing the final two CRUD operations: Update (**PATCH**) and Delete (**DELETE**)

Sequence Diagrams

Challenges Encountered & Solutions

- **Challenge 1: The "405 Method Not Allowed" Error:** Testing the specific book endpoint (`/api/books/1/`) in a web browser resulted in an error because the browser defaults to a **GET** request, and our view was only built for updates and deletions.
- **Solution:** Implemented a dedicated `get()` method inside the `BookDetailView` class to safely render the API page.
- **Challenge 2: Silent Deletion Failures:** Executing a delete command in Postman returned a success code, but the database remained unchanged.
- **Solution:** Discovered the request method was accidentally left on **GET** instead of **DELETE**. Correcting the HTTP method mapping resolved the issue.
